

## Frontend Technical Test

Congratulations!! You have been hired to work on a landing page for a software company. Here is the client's mockup:

Given the mockup you must:

- Replicate it as closely as possible, using HTML5 and CSS3. This includes best practices and code readability and maintainability.
- You must design and implement the site's footer. The client has requested that it must "work well" with the current mockup and it must have a modern-day design.
- The site must be responsive (desktop, tablet and mobile) and cross browser (IE8+, Firefox, Google Chrome, Safari)
- For the Company's Location (google maps image) you may choose to use an image or to implement an actual use of embedded google maps, this is considered optional.

#### Technical Requirements

- HTML5
- CSS3
- Bootstrap
- Gulp or Grunt (optional)
- SASS (optional)
- Javascript framework of your choice (optional)

No images are given to you, so you must include your own images. The text on the page can remain as it is, you do not have to make up any text.
